Геномика
Лекция №22

Понятние геномики, структурная геномика, функциональная геномика, фармакогеномика, популяционная геномика, сравнительная геномика, эволюционная геномика. История геномных технологий. Структуры эукариотических и прокариотических геномов. Ортология, паралогия, синтения, COGs (clusters of orthologous groups). Геном человека. Генетические вариации. Понятие гаплотипа и гаплогруппы. Геномные проекты: геном человека, 1000 Genomes, Epigenomics Roadmap, ENCODE, 4D nucleome, TCGA, ICGC. GWAS исследования, связь генотип-фенотип. Заболевания наследуемые по Менделю и комплексные заболевания. Базы данных dbSNP, OMIM, ClinVar. Геномные браузеры. Демонстрация браузера Ensembl.

Алексей Константинович Шайтан, к.ф.-м.н.

Геномика

- **Гено́м** — совокупность наследственного материала, заключенного в клетке организма.
- **Геномика** – изучение строения, работы, функций генов и геномов.
- Геномика тесно связана с биоинформатикой и технологиями секвенирования.
- **Functional genomics** is a field of molecular biology that attempts to make use of the vast wealth of data given by genomic and transcriptomic projects (such as genome sequencing projects and RNA sequencing) to describe gene (and protein) functions and interactions.
- **Comparative genomics** is a field of biological research in which the genomic features of different organisms are compared.
- **Population genomics** is the large-scale comparison of DNA sequences of populations.
- **Metagenomics** is the study of genetic material recovered directly from environmental samples
- **Pharmacogenomics** is the study of how genes affect a person's response to drugs.
- **Structural genomics** seeks to describe the 3-dimensional structure of every protein encoded by a given genome.

Омиксные технологии

- Транскриптомика
- Протеомика
- Метаболомика
- Эпигеномика
- Липидомка
- Гликомика

- Omics aims at the collective characterization and quantification of pools of biological molecules that translate into the structure, function, and dynamics of an organism or organisms.

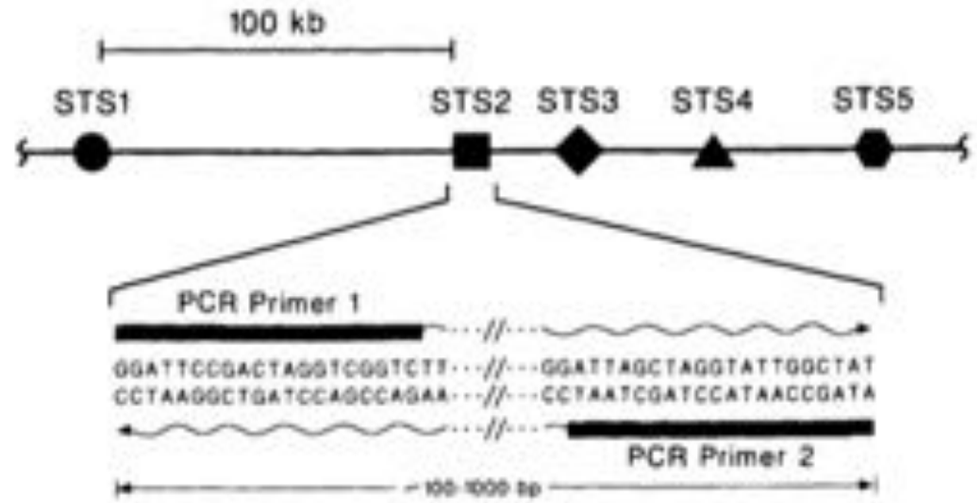
Sequence-Tagged Sites (STS)

https://www.ncbi.nlm.nih.gov/dbSTS/

STS is a relatively short, easily PCR-amplified sequence (200 to 500 bp) which can be specifically amplified by PCR and detected in the presence of all other genomic sequences and whose location in the genome is mapped.



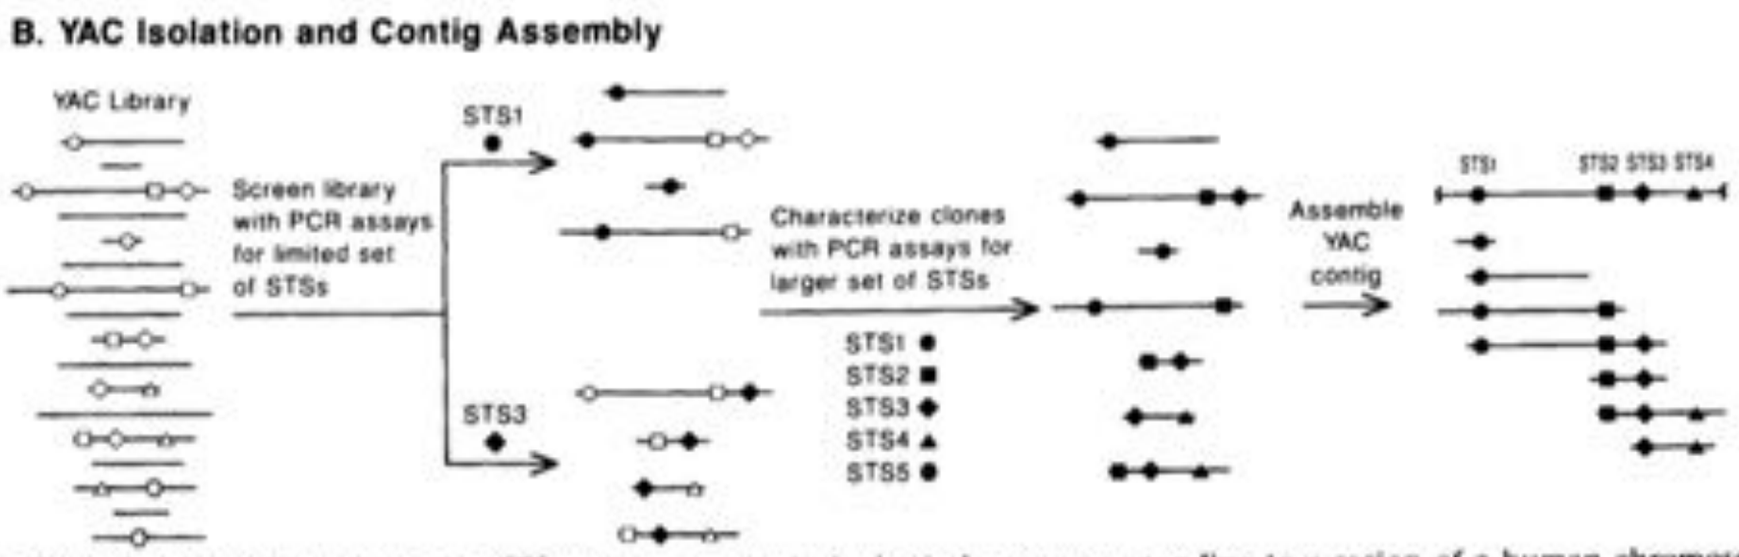


FIGURE 1 General strategy for constructing STS-content maps. (A) A physical map corresponding to a region of a human chromosome is

https://genome.cshlp.org/content/1/2/77.full.pdf

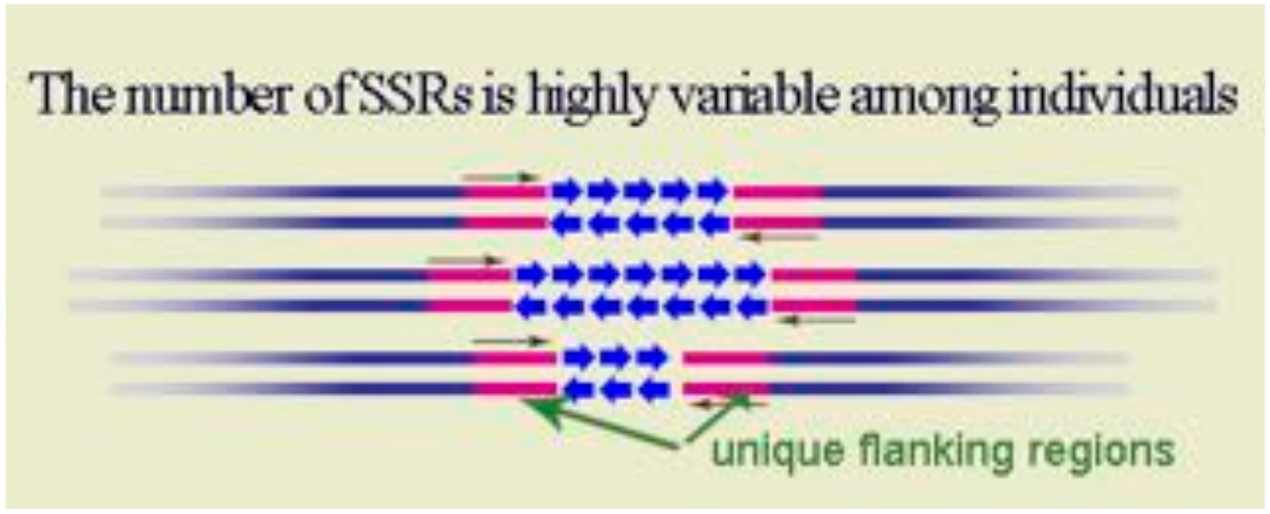
Генетические маркеры

https://www.ncbi.nlm.nih.gov/probe

- When STS loci contain genetic polymorphisms, they become valuable genetic markers, i.e. loci which can be used to distinguish individuals.
- A **genetic marker** is a gene or DNA sequence with a known location on a chromosome that can be used to identify individuals or species.

Some commonly used types of genetic markers are:

- RFLP (or Restriction fragment length polymorphism)
- SSLP (or Simple sequence length polymorphism)
- AFLP (or Amplified fragment length polymorphism)
- RAPD (or Random amplification of polymorphic DNA)
- VNTR (or Variable number tandem repeat)
- SSR Microsatellite polymorphism, (or Simple sequence repeat)
- SNP (or Single nucleotide polymorphism)
- STR (or Short tandem repeat)
- SFP (or Single feature polymorphism)
- DArT (or Diversity Arrays Technology)
- RAD markers (or Restriction site associated DNA markers)



Генетические маркеры
ДНК-дактилоскопия (DNA profiling)

Twenty CODIS Core Loci

In early 2015, the FBI announced that the validation project for additional CODI
had been completed and that an additional seven loci would be added to the C
effective January 1, 2017.[3] The additional seven loci—D1S1656, D2S441, D2S
D10S1248, D12S391, D19S433 and D22S1045—along with the original 13 loci
comprise the new CODIS Core Loci. Below is a listing of the 20 CODIS Core Lo

В России 3 декабря 2008 года Госдума приняла Федеральный закон «О государственной геномной регистрации в Российской Федерации»[19]. По этому закону создана федеральная база данных ДНК, содержащая информацию об осуждённых за тяжкие и особо тяжкие преступления, за преступления против половой неприкосновенности, а также о неопознанных трупах и о биологических следах, изъятых с мест совершения преступлений. Оператором базы данных является МВД России.

LETTERS

The complete genome of an individual by massively parallel DNA sequencing

David A. Wheeler[1]*, Maithreyan Srinivasan[2]*, Michael Egholm[2]*, Yufeng Shen[1]*, Lei Chen[1], Amy McGuire[3], Wen He[2], Yi-Ju Chen[2], Vinod Makhijani[2], G. Thomas Roth[2], Xavier Gomes[2], Karrie Tartaro[2]†, Faheem Niazi[2], Cynthia L. Turcotte[2], Gerard P. Irzyk[2], James R. Lupski[4,5,6], Craig Chinault[4], Xing-zhi Song[1], Yue Liu[1], Ye Yuan[1], Lynne Nazareth[1], Xiang Qin[1], Donna M. Muzny[1], Marcel Margulies[2], George M. Weinstock[1,4], Richard A. Gibbs[1,4] & Jonathan M. Rothberg[2]†

The association of genetic variation with disease and drug response, and improvements in nucleic acid technologies, have given great optimism for the impact of 'genomic medicine'. However,

subject's DNA, including single nucleotide polymorphisms (SNPs), small insertions and deletions (indels), and copy number variation (CNV).

Description: Genome Reference Consortium Human Build 38 patch release 12 (GRCh38.p12)
Organism name: Homo sapiens (human)
BioProject: PRJNA31257
Submitter: Genome Reference Consortium
Date: 2017/12/21
Assembly type: haploid-with-alt-loci
Release type: patch
Assembly level: Chromosome
Genome representation: full
GenBank assembly accession: GCA_000001405.27 (replaced)

See Genome information for **Homo sapiens**

Finishing the euchromatic sequence of the human genome

International Human Genome Sequencing Consortium

Nature **431**, 931–945 (2004) | Download Citation ⭳

this finishing process. The current genome sequence (Build 35) contains 2.85 billion nucleotides interrupted by only 341 gaps. It covers ~99% of the euchromatic genome and is accurate to an error rate of ~1 event per 100,000 bases. Many of the remaining euchromatic gaps are associated with segmental duplications and will require focused work

Аннотация геномов

- Структурная аннотация – разбивка генома на гены.
- Функциональная аннотация – функции генов, экспрессия, регуляция.
- Возможны чисто вычислительные алгоритмы поиска генов.
- Поиск открытых рамок считывания (ORF), поиск гомологов
- Важную роль играли/играют Expressed Sequence Tags (EST) и данные RNAseq
- Понятие complementary DNA, cDNA, кДНК.

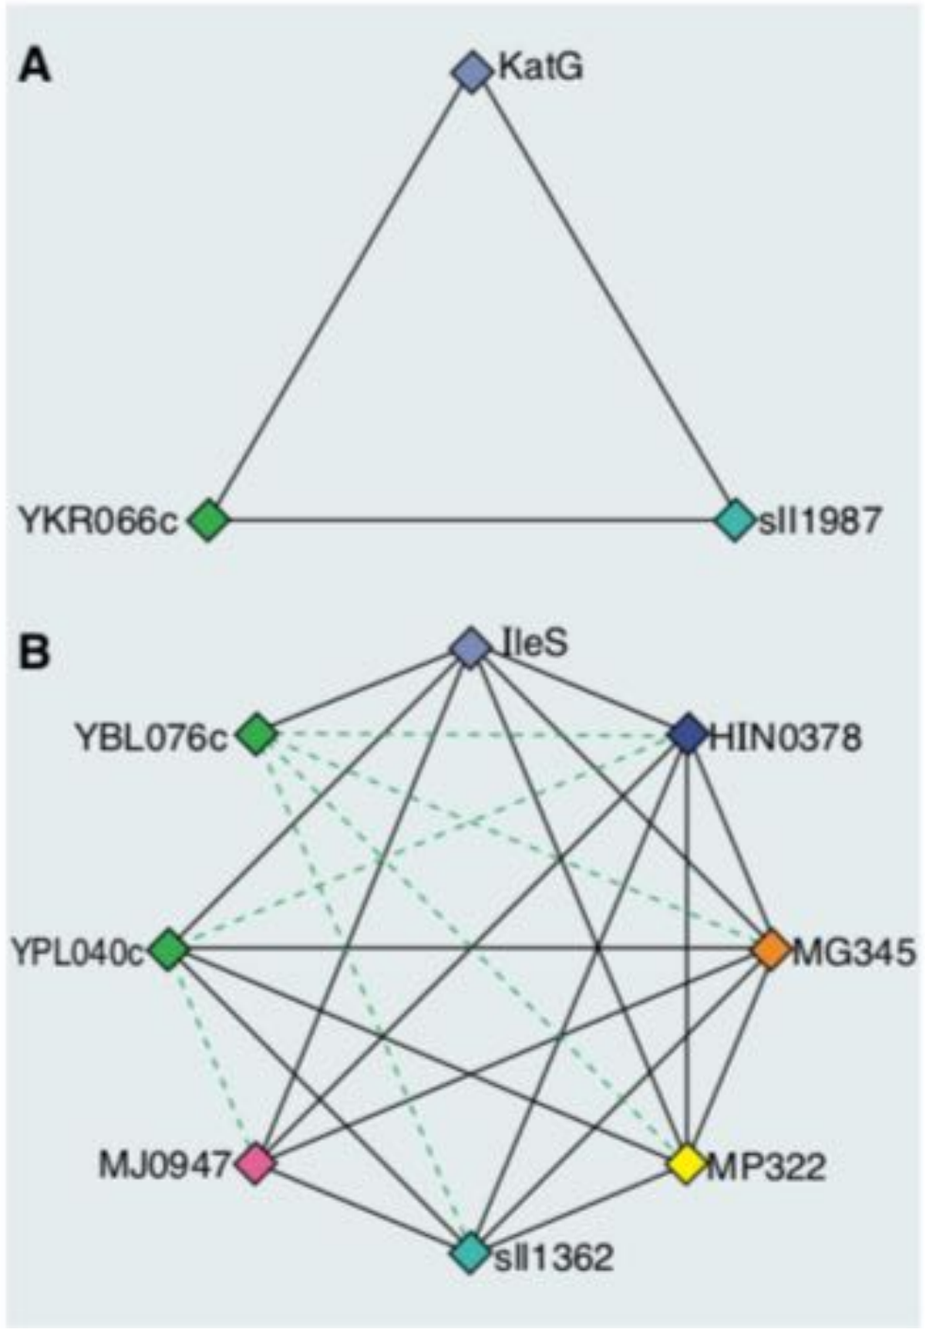
COGs

Phylogenetic classification of proteins encoded in complete genomes



A Genomic Perspective on Protein Families

Roman L. Tatusov, Eugene V. Koonin,* David J. Lipman

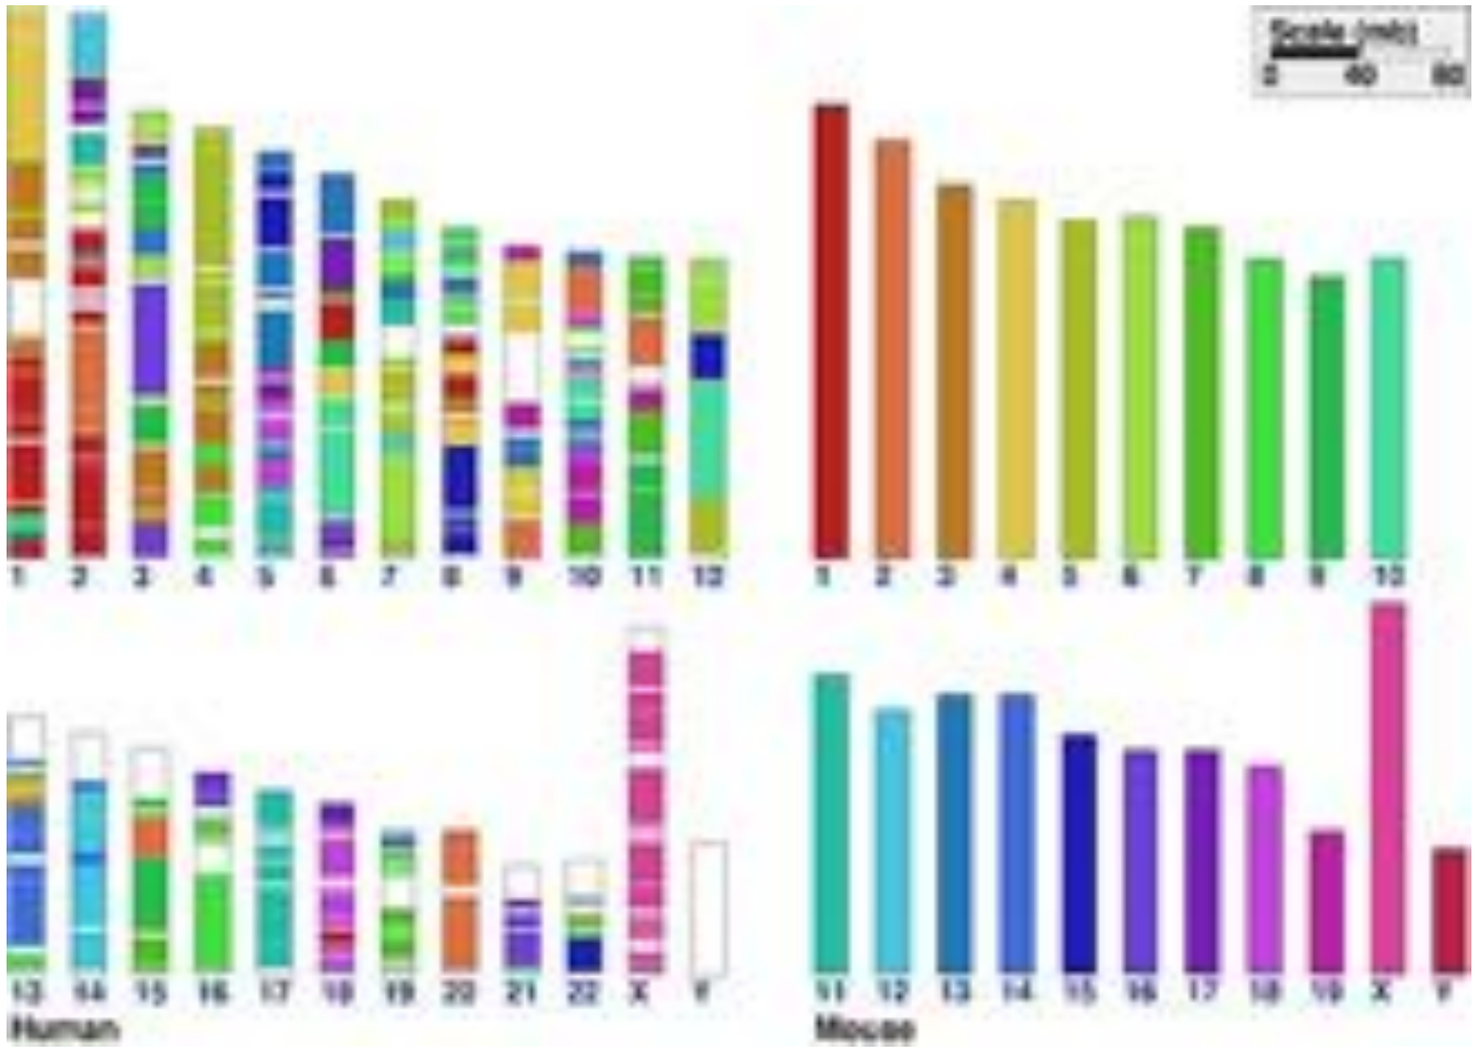
Science 24 Oct 1997:
Vol. 278, Issue 5338, pp. 631-637
DOI: 10.1126/science.278.5338.631

Fig. 1. Examples of COGs. Solid lines show symmetrical BeTs. Broken lines show asymmetrical BeTs, with color corresponding to the species for which the BeT is observed. Genes from the same species are adjacent; otherwise the gene names are positioned arbitrarily. A unique COG ID is indicated in the upper left corner. (**A**) Congruent BeTs form a triangle, the minimal COG. Origin of the proteins: KatG, *E. coli*; sll1987, *Synechocystis* sp.; and YKR066c, *S. cerevisiae*. Note that all the BeTs are symmetrical. (**B**) A simple COG with two

Сравнительная/эволюционная геномика

Синтения

synteny -- the conservation of blocks of order within two sets of chromosomes that are being compared with each other.



Synteny between human and mouse chromosomes. Colors indicate homologous regions. For instance, sequences homologous to mouse chromosome 1 are primarily on human chromosomes 1 and 2, but also 6,8, and 18. The X chromosome is almost completely syntenic in both species

dbSNP

dbSNP contains human single nucleotide variations, microsatellites, and small-scale insertions and deletions along with publication, population frequency, molecular consequence, and genomic and RefSeq mapping information for both common variations and clinical mutations.

TAS2R38 gene:

Linked to the taste of bitter in broccoli, Brussels sprouts, cabbage, watercress, chard, ethanol, and PROP. [ref]

rs713598(G;G)

Possibly unable to taste bitter in some foods. Depending on your other SNPs, this might cause the inability to taste the bitterness of phenylthiocarbamide (PTC) and similar molecules in foods (like cabbage and raw broccoli) or drinks (like coffee and dark beers). That would make cabbage etc. taste horribly bland and boring. On the other hand, fruit from the tropical bignay tree would taste unpleasantly bitter to you instead of sweet. You might eat less healthily.

.0001 PHENYLTHIOCARBAMIDE TASTING

TAS2R38, ALA49PRO dbSNP:rs713598 RCV000003038
Within the PTC gene, Kim et al. (2003) found 3 common polymorphisms that influence the ability to taste phenylthiocarbamide (see 171200). One was a 145G-C transversion, resulting in an ala49-to-pro (A49P) substitution (rs713598).

.0002 PHENYLTHIOCARBAMIDE TASTING

TAS2R38, VAL262ALA dbSNP:rs1726866 RCV000003039
Certain haplotypes of polymorphisms within the PTC gene account for the ability to taste or not taste phenylthiocarbamide (see 171200). Kim et al. (2003) found one of these to be a 785T-C transition, resulting in a val262-to-ala (V262A) substitution (rs1726866).

.0003 PHENYLTHIOCARBAMIDE TASTING

TAS2R38, ILE296VAL dbSNP:rs10246939 RCV000003040
Kim et al. (2003) identified an 886A-G transition in the PTC gene, resulting in an ile296-to-val (I296V) substitution (rs10246939). This polymorphism, in conjunction with other SNPs in the gene, give rise to the ability to taste or not taste phenylthiocarbamide (see 171200).

TEXT

▼ Description

TAS2R38 belongs to the large TAS2R receptor family. TAS2Rs are expressed on the surface of taste receptor cells and mediate the perception of bitterness through a G protein-coupled second messenger pathway (summary by Conte et al., 2002). For further information on the TAS2R gene family, see 604791.

Гаплотипы

A **haplotype** (haploid genotype) is a group of alleles in an organism that are inherited together from a single parent.

Genetic linkage is the tendency of DNA sequences that are close together on a chromosome to be inherited together during the meiosis phase of sexual reproduction.

Analysis Name and Accession

Name: GWAS for alcohol dependence in European-Americans
Accession: pha002892.1

View association results in Genome Browser

Analysis Description

To identify common variants underlying alcohol-dependence, probands were ascertained through alcohol treatment programs and evalu
and their relatives were administered a validated poly-diagnostic instrument, the Semi- Structured Assessment for the Genetics of Alco
performed by the Center for Inherited Disease Research (CIDR). DNA sources included blood (n = 1453) and lymphoblastoid cell lines

Analysis Methods

Sample QC filters consisted of 98% genotyping completeness, unrelatedness of subjects (n = 9). A principal component-based analys
either the European or African-American groups and were excluded. EA and AA SNP QC filters (applied separately in each group) wer
was performed in PLINK adjusting for sex.

SNPedia

SNPedia is a wiki investigating human genetics. We share information about the effects of variations in DNA, citing peer-reviewed scientific publications. It is used by Promethease to create a personal report linking your DNA variations to the information published about them. Please see the SNPedia:FAQ for answers to common questions.
